

Grocery App...with a Twist!

>>>>

Need Statement: Help busy students get food conveniently and allow students with financial constraints to obtain food bank items that fit their schedule at no cost to improve campus food security.

Design Approach: We designed a mobile application based on a campus vending-locker model. Verified food-insecure students can use the app to access food resources at no cost, while other students can purchase food items from vending lockers located at common UBC student hubs.

Design Goals and Prototype Objectives: Our system prioritizes inclusivity to ensure users can access food resources without fear of social stigma. Users should also be able to efficiently find food items using our interface. To support this, the prototype features a **clean, simple aesthetic that minimizes distractions**, while utilizing highly visible buttons and consistent styling to guarantee **intuitive wayfinding**.

Instructions

.....

If User = Regular: The app functions as a standard grocery app
(Add to cart -> Calculate Total -> Pay -> Get Locker QR Code).

- The presenter will demonstrate: As a regular customer order 1 **lettuce and 2 tomatoes**; pay through Apple Pay; pick up at IKB at 3-5pm on Nov 25

Instructions

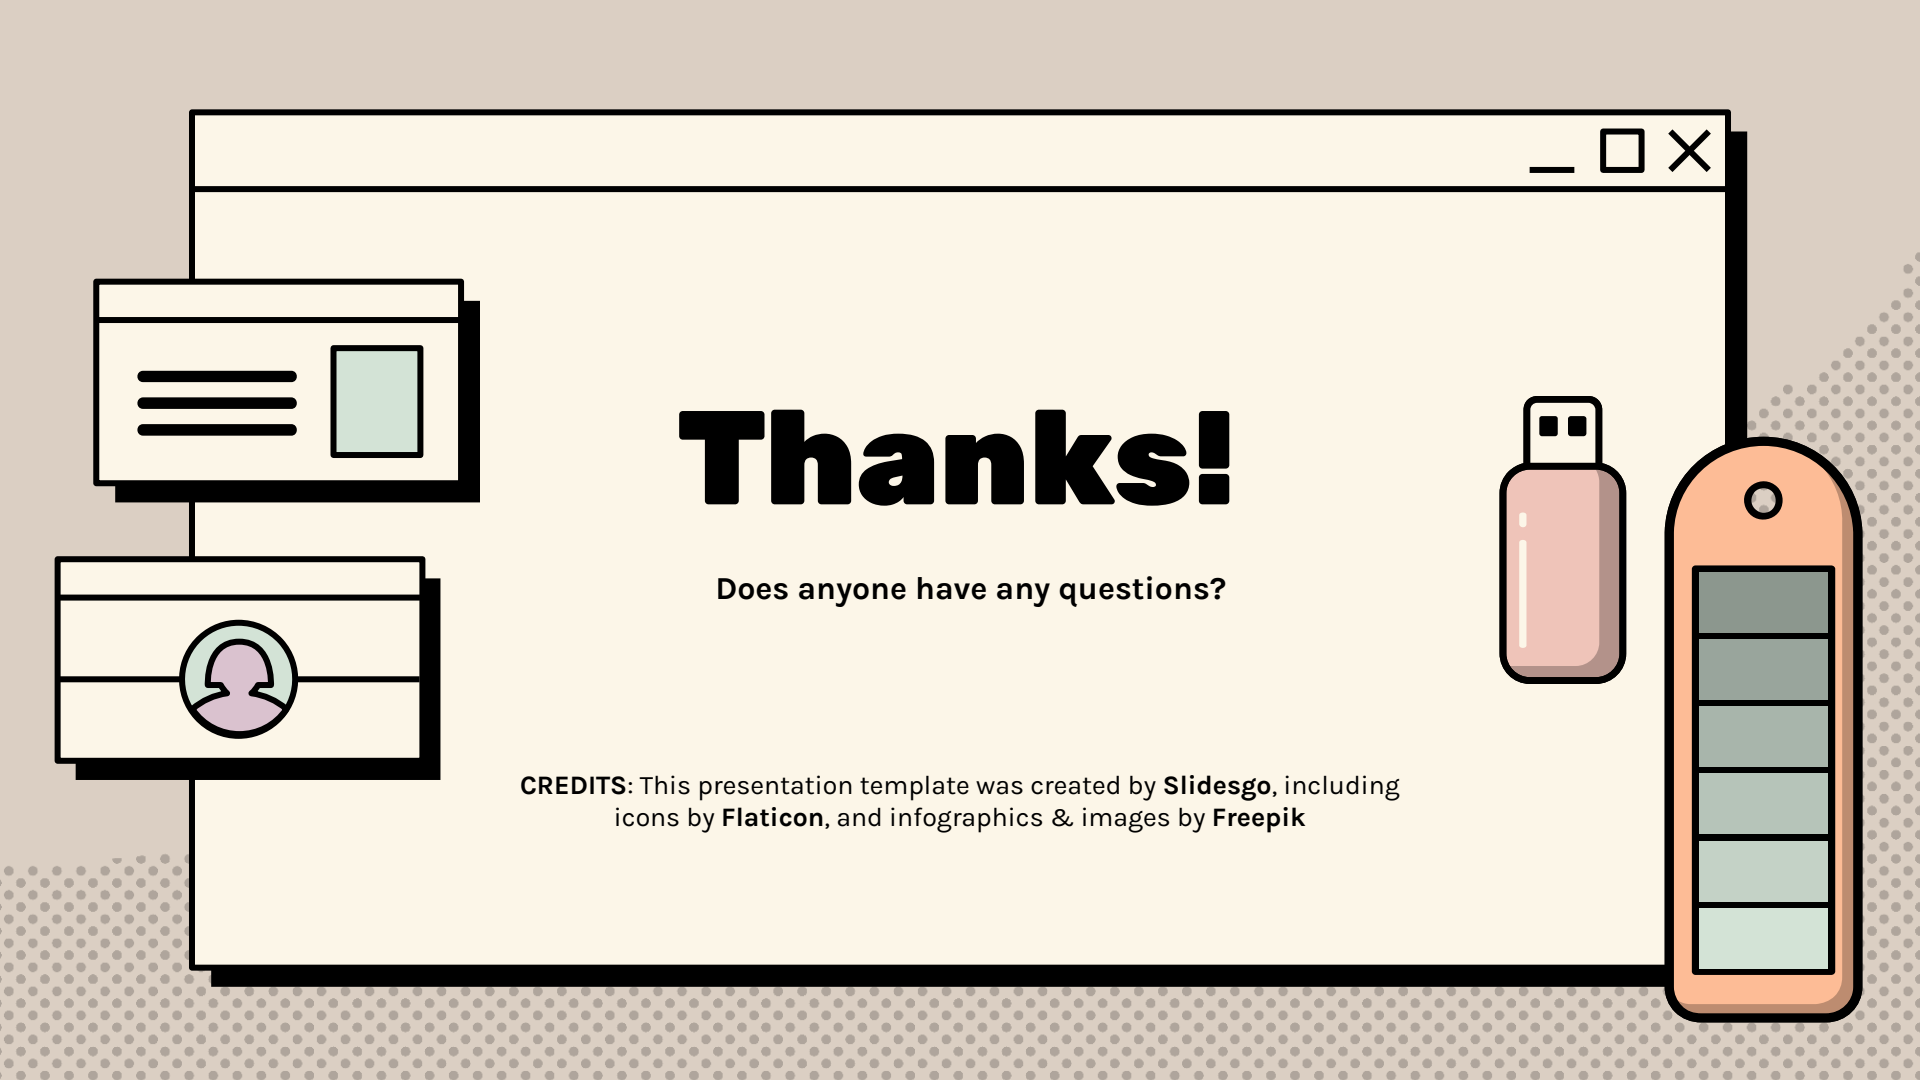

.....

If User = Verified Food Bank: The app bypasses the payment gateway (Add to cart -> Total becomes \$0 -> Skip Payment -> Get Locker QR Code).

- Task for audience: As a food bank user, order a **1 can of black bean, 1 can of corn and 2 cans of tuna**; pick up at IKB at 3-5 pm on Nov 25

Thanks!

Does anyone have any questions?
